

# Tracing the geographical origin of *Lymantria dispar* by stable isotope analysis

Reported by: Zeshi Qin/ Nicolas

Supervisor: Prof. Juan Shi

Date: January 18<sup>th</sup>, 2023

# 1 Research background

## 1.1 Object

- *Lymantria dispar* (L.) (Lepidoptera: Erebidae) (Boukouvala *et al.*, 2022), an international quarantine pest, whose larval stage can feed on more than 500 species trees (Beurs *et al.*, 2008; Kostić *et al.*, 2008; Cao *et al.*, 2015).
- The International Union for Conservation of Nature (IUCN) has listed *L. dispar* as one of the 100 worst invaders globally (Lowe *et al.*, 2000).
- In 2016, more than 1 million acres of land were destroyed by spongy moths in the 20 states surveyed (USDA, 2018).

Male ♂

Female ♀

The screenshot shows the '100 of the World's Worst Invasive Alien Species' list from the Global Invasive Species Database. It features the 'TOTAL' logo and a list of species. The entry for *Lymantria dispar* is highlighted in red. The entry text reads: '48. *Lymantria dispar* Lymantria dispar, commonly known as the Asian gypsy moth, is one of the most destructive pests of shade, fruit and ornamental trees throughout the Northern Hemisphere. It is also a major pest of hardwood forests. Asian gypsy moth caterpillars cause extensive defoliation, leading to reduced growth or even mortality of the host tree. Their presence can destroy the aesthetic beauty of an area by defoliating and killing the trees and covering the area with their waste products and silk. Some areas that were once beautiful have become desolate with dead standing trees where the Asian gypsy moth has invaded. Also, poisonous hairs on larvae and egg masses cause allergies in some people. Common Names: Asian gypsy moth, erica (guapeque), gusa, gypsy moth, lagarta peluda, lmantria, ♀Vishasnoone, manna-ga, mrisaka vol, ♀kohiava, neparny shaykopyad, Schwanenspinner, spongeuse.

## 1.3 Theoretical Basis

# 1 Research background

---

## 1.4 experimental considerations

- The isotope ratio of spongy moth is considered as a regionalized variable reflecting the spatial distribution.
- Establishing an authentic isotope reference database by sampling and detecting spongy moth in different environments.

### Part 1

Hydrogen stable isotope analysis

- Determination of isotope ratio of samples
- Obtain environment variable data set
- Analyze the correlation between precipitation and isotope ratios
- Visual reference mark database

### Part 2

Carbon stable isotope analysis

- Determination of isotope ratio of samples
- Obtain environment variable data set
- Constructing kriging interpolation model
- Visual reference mark database

## 2 Research steps-Hydrogen

### 2.1 Sampling sites

From May 2016 to June 2019, a total number of 284 *L. dispar* adults were captured in five geographic regions

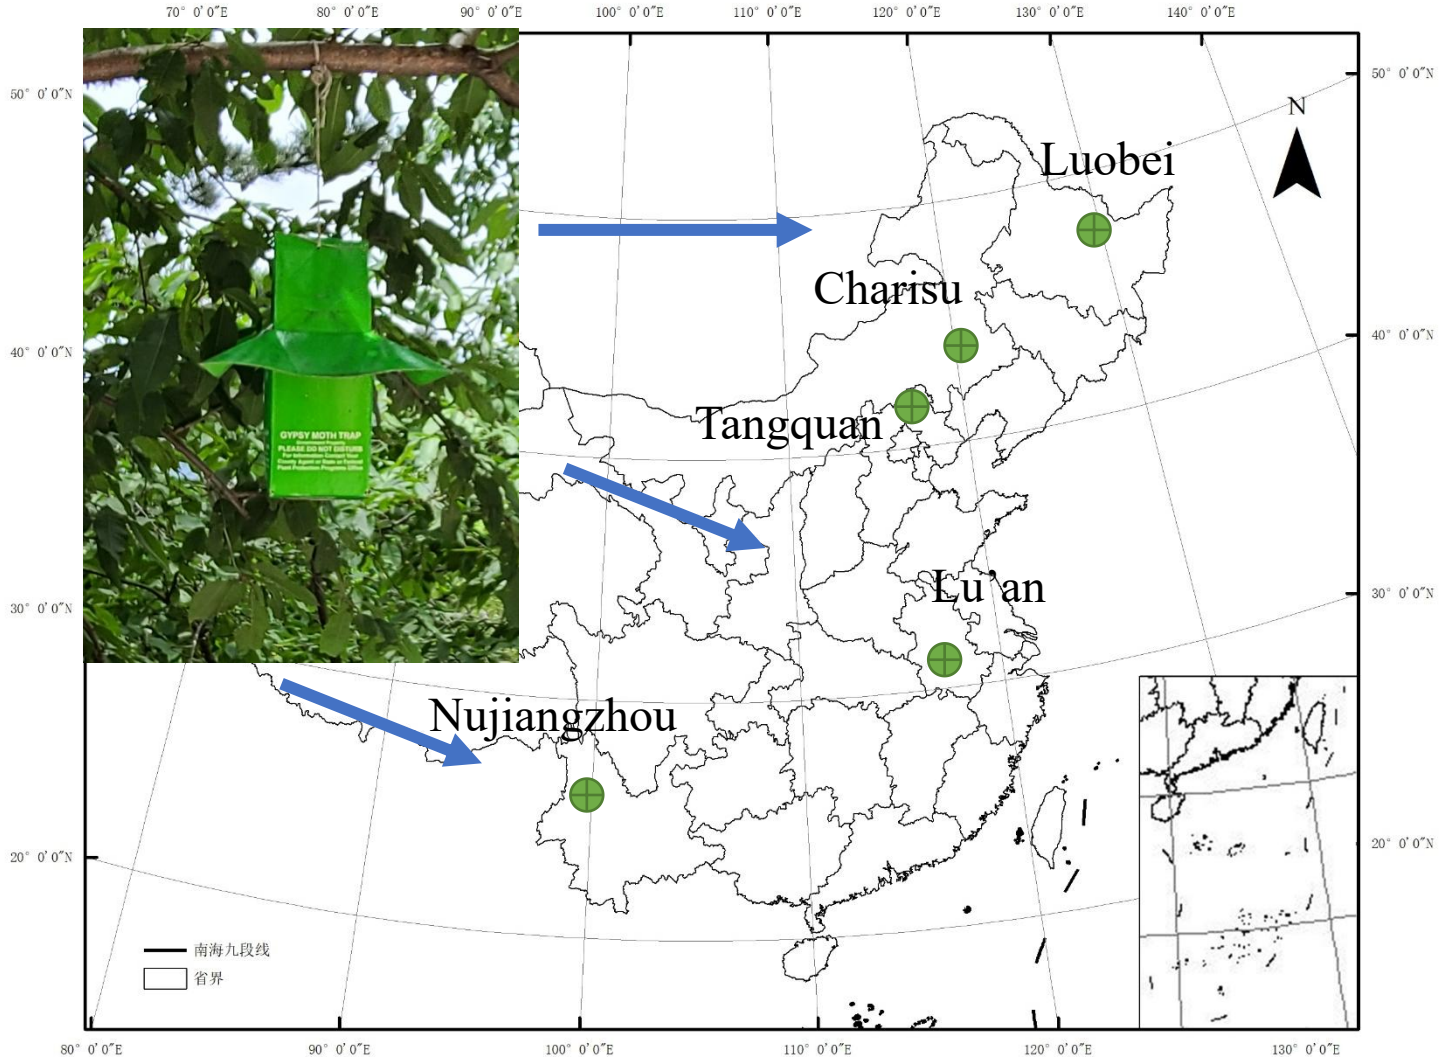

Figure 2. Sampling location

## 2 Research steps-Hydrogen

### 2.2 Treatment of research objects

before degreasing

chloroform: methanol

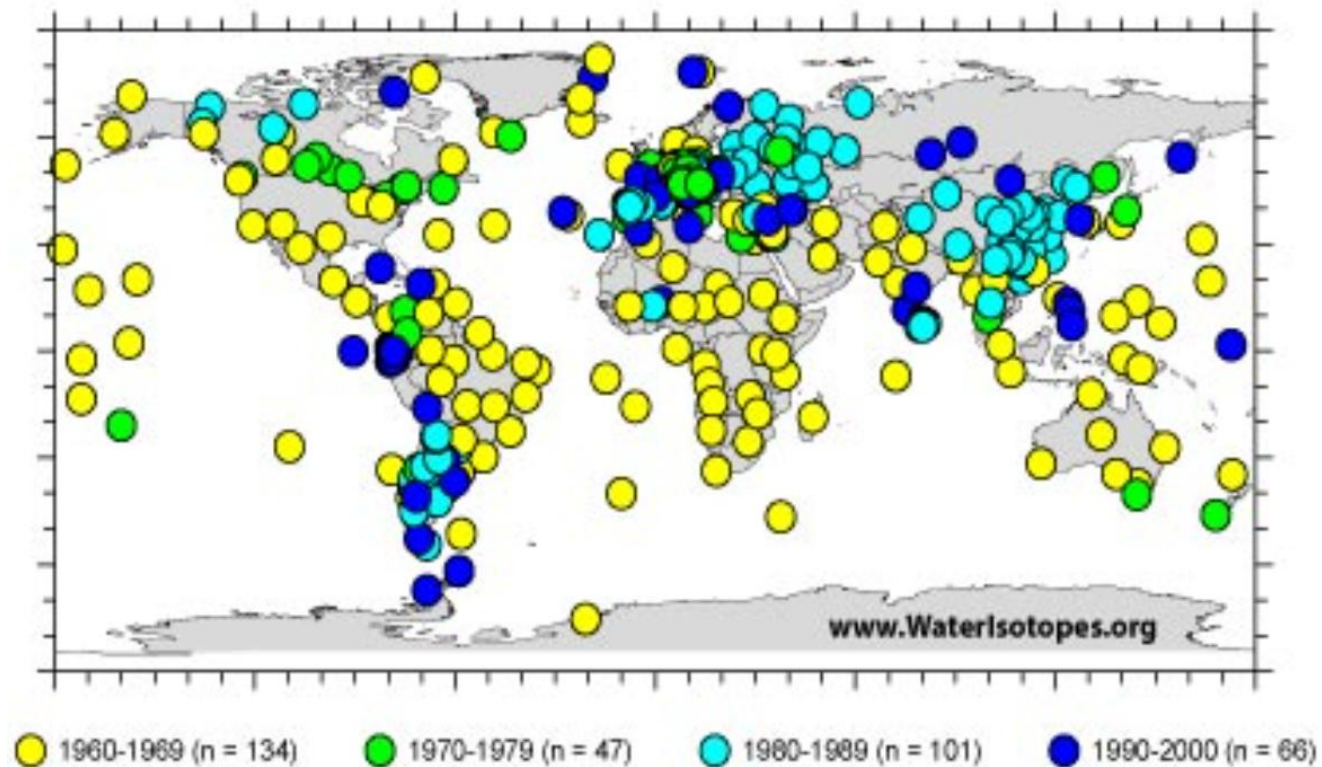

GC-MS

after degreasing

## 2 Research steps-Hydrogen

### 2.3 Environment variable

The grid data of hydrogen stable isotope in global precipitation were downloaded from the Online Isotopes in Precipitation Calculator (OIPC; Bowen and Revenaugh, 2003, Bowen, 2017)

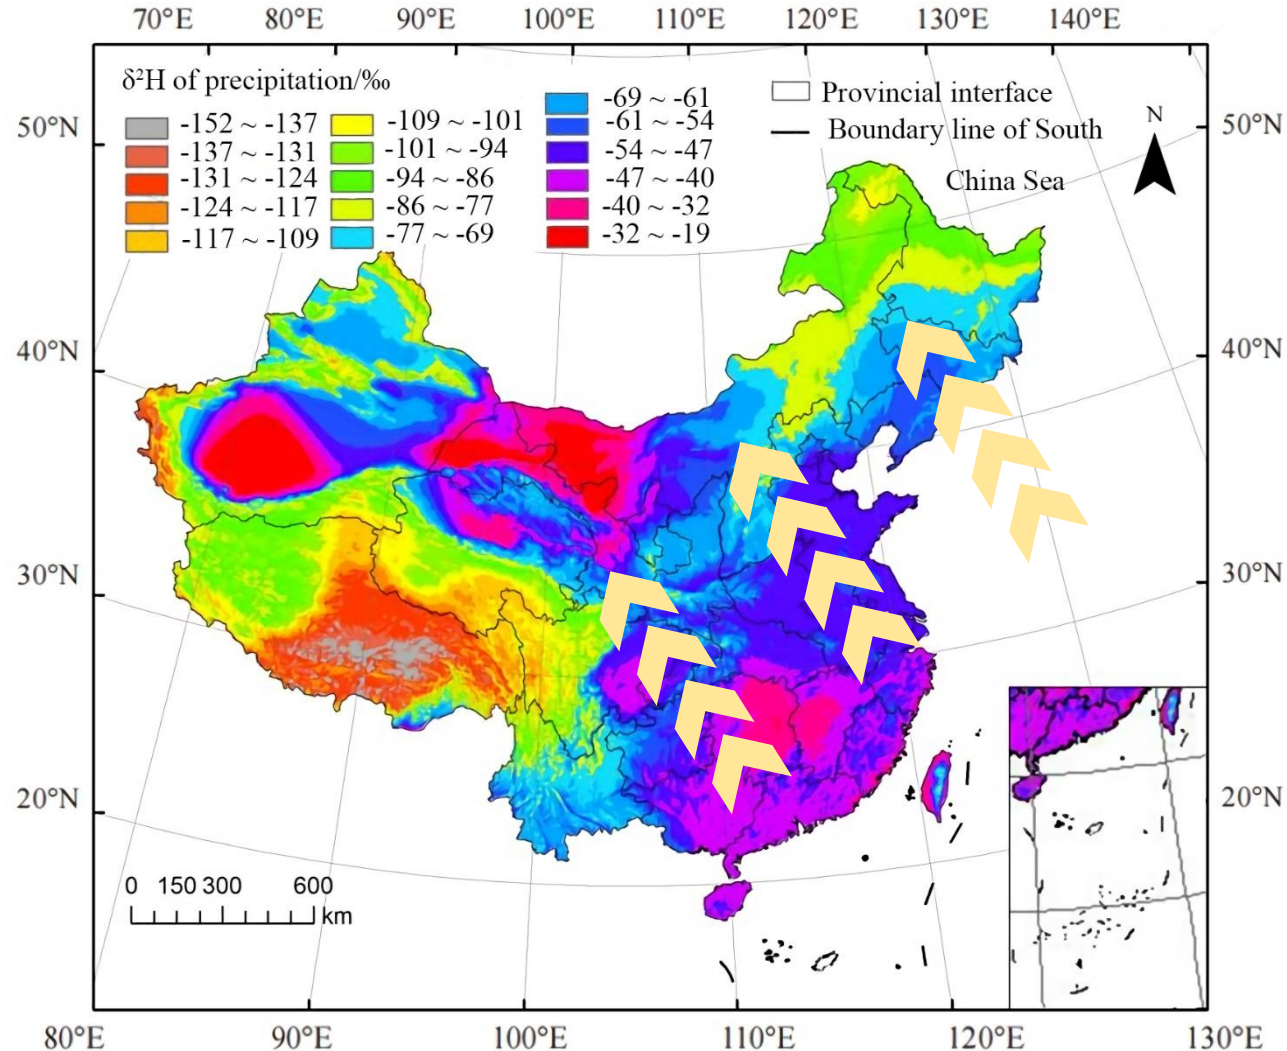

**Fig. 3 Year of  $\delta^2\text{H}$  Observation at 348 GNIP Stations**

## 3 Research results-Hydrogen

### 3.1 Distribution of $\delta^2\text{H}$ Value in Precipitation

$\delta^2\text{H}$  value in precipitation had regular changes, with a slight decreasing gradient from southeast to northwest. This isotope base map was later used as the basis for spongy moth source determination.

**Fig. 4 Zoning map of hydrogen stable isotopes in precipitation**

## 3 Research results-Hydrogen

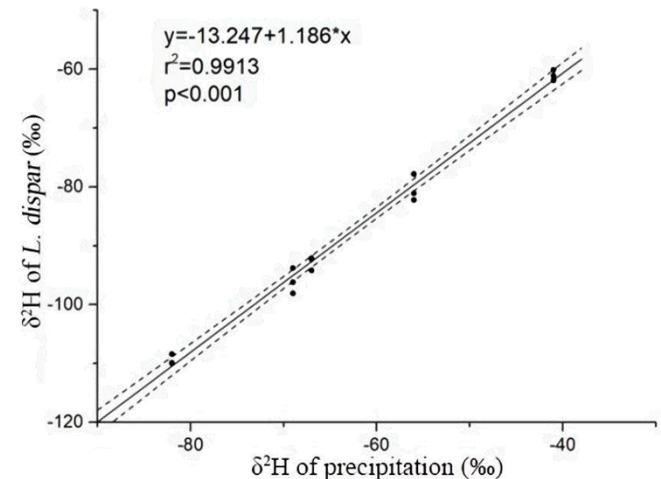

### 3.3 Use of Software R and Origin to Model and Test

**Tab. 1  $\delta^2\text{H}$  value of spongy moth in the five locations in China. Measured data are mean  $\pm$  sD.  $n = 3$  biological replicates.**

Place (Regions)	Longitude (East)	Latitude (North)	Height (m)	$\delta^2\text{H}$ (‰) of <i>L. dispar</i> (Measured Value)	$\delta^2\text{H}$ (‰) of Precipitation (Theoretical Value)
Heilongjiang Province (Luobei, $n = 3$ )	130.83	47.58	83	$-109.4 \pm 0.70$	-82
Yunnan Province (Nuijiangzhou, $n = 3$ )	98.77	25.86	2057	$-96.0 \pm 1.75$	-69
Neimenggu Province (Charisu, $n = 3$ )	123.47	43.13	121	$-92.9 \pm 0.93$	-67
Hebei Province (Tangquan, $n = 3$ )	117.96	40.95	135	$-80.4 \pm 1.87$	-58
Anhui Province (Lu'an, $n = 3$ )	116.52	31.73	75	$-61.0 \pm 0.72$	-41

**Tab.2 Test results of equation fitting.**

Items	Value
Residual standard error	1.645 on 13 degrees of freedom
Multiple $R$ -squared	0.9913
Adjusted $R$ -squared	0.9906
$F$ -statistic	1474 on 1 and 13 DF
$p$ -value	$9.09 \times 10^{-15}$

**Fig.5 Standard curve equation.**

## 4 Research steps-Carbon

### 4.1 Sampling sites

In 2020, 423 samples were collected from Yingxian in Shanxi Province, Chunhua in Shaanxi Province, Ulanhot and Kudu in Inner Mongolia, Chengdu in Sichuan Province, and Xifeng in Guizhou Province.

In 2021, 372 samples were collected from Qingdao in Shandong Province, Lianyungang in Jiangsu Province, Panshan in Tianjin, Chifeng in Inner Mongolia, Dalian in Liaoning Province, and Zhaodong in Heilongjiang Province.

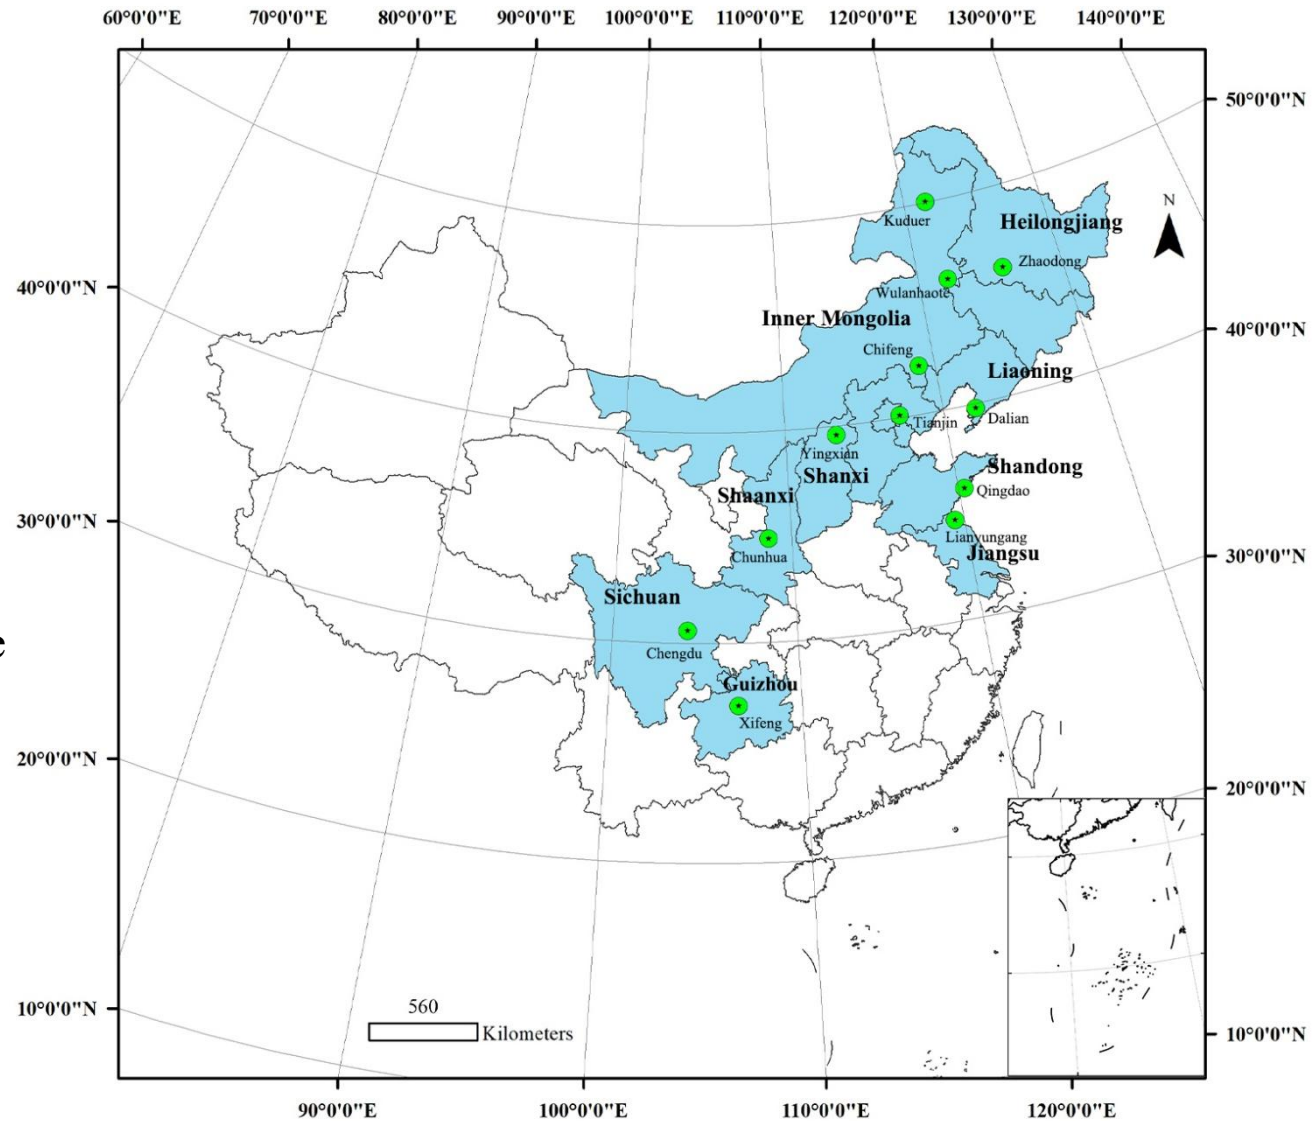

Fig. 8 Sampling location

## 4.2 Experimental considerations

(1) Filter environment variables

$$\rho_{xy} = \frac{Cov(X,Y)}{\sigma_X \sigma_Y}$$

$Cov(X, Y)$  represents the covariance between any factor X and Y,  $\sigma_X$  is the standard deviation of X,  $\sigma_Y$  is the standard deviation of Y.

The environmental variables screened in the above steps are tested for multicollinearity through the variance expansion factor VIF.

$$VIF_k = \frac{1}{1 - R_k^2}$$

It is generally believed that VIF is not greater than 10, and there is no collinearity between independent variables.

(2) Calculating the correlation between environmental variables and C stable isotope ratio of spongy moth

**Tab. 4 Environmental Variables**

- The SD of C isotope ratio of samples in the same area is  $\pm 0.3863$  (n=5).
- The maximum difference of C isotope value among the same location is 0.7726

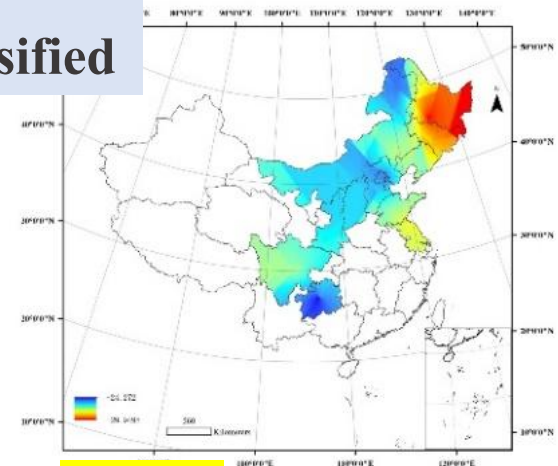

- When the number of classification groups is 5, the interval difference of C isotope value is about 1.00 ( $0.7726 < 1.00$ )
